

RIM markers

nmr-1 identifies AVA_AVE; AVD_PVC; RIM in Packer L2 list so isn't unique to RIM. In Packer Emb data, RIM isn't its most enriched celltype

acr-6 wasn't a significant marker by Seurat, but there's a "dot" in the "RIM" cluster -- maybe it's because expression isn't very strong.

tdc-1 expression very specific to RIM and RIC. Identified cluster 25 as RIC first. So cluster 26_1 is RIM
