

10 markers from Packer L2 list. 2 not significant by Seurat -- sra-6 wasn't detected in any cells; snf-11 identifies GLR; hmc; mu_int_mu_anal; PVQ; RME in L2 and ALA; DD; RME in Emb so may be not a very strong/unique marker for PVQ.

nlp-17 seems to be expressed very specifically in PVQ. See Taylor 2019 Fig S6 (read legend). Another work also identifies nlp-17 to be specific to PVQ (Combining single-cell RNA-sequencing with a molecular atlas unveils new markers for Caenorhabditis elegans neuron classes, Table 1)
