

Excretory_gland markers

Cluster 12 has a perfect correlation with excretory cells by Label Tranfer from Cao L2 (median predicted_id_score is 1, and good mapping too), and the majority of predicted "excretory cells" are in cluster 12. See the spreadsheet in the same folder as this pdf.

However, it seems like that "excretory cells" category is actually excretory gland? b/c if you look at marker heatmaps of excretory cell/gland/duct, only gland seems to correlate well with cluster 12.
